1. Purpose of document

This document describes the Product User Guide (PUG) of the RemoTeC XCH₄ GOSAT-2 SRON Proxy Product (CH₄_GO₂_SRPR), which is a deliverable for the ESA GHG-CCI+ project led by University of Bremen, Germany.

Within the project, satellite-derived atmospheric Carbon Dioxide (CO₂) and Methane (CH₄) Essential Climate Variable (ECV) data products are generated and delivered to ESA for inclusion into the ESA-GHG-CCI+ database from which users can access these data products and the corresponding documentations.

The satellite-derived data products are:

- Column-averaged dry-air mixing ratios (mole fractions) of CO₂ and CH₄, denoted XCO₂ (in parts per million, ppm) and XCH₄ (in parts per billion, ppb), respectively.

This document will be focused on the XCH₄ Level-2 product retrieved using the GOSAT-2 Proxy algorithm developed by SRON Netherlands Institute for Space Research, The Netherlands.

2. Greenhouse gases Observing SATellite-2 (GOSAT-2)

The Japanese Greenhouse gases Observing SATellite-2 (GOSAT2) was launched on 29th October 2018 and started operational observations from February 2019. GOSAT2 provides dedicated global measurements of total column CO₂ and CH₄ from its SWIR bands. It is equipped with two instruments, the Thermal And Near Infrared Sensor for carbon Observations - Fourier Transform Spectrometer-2 (TANSO-FTS2) as well as a dedicated Cloud and Aerosol Imager-2 (TANSO-CAI-2).

The TANSO-FTS2 instrument (Nakajima et al., 2017) has five spectral bands with a high spectral resolution 0.2 cm⁻¹. Three operate in the SWIR at 0.75-0.77, 1.56-1.69 and at the extended 1.92-2.33 µm range, providing sensitivity to the near-surface absorbers. The fourth and fifth channels operating in the thermal infrared between 5.5-8.4 and 8.4-14.3 µm providing mid-tropospheric sensitivity.

The measurement strategy of TANSO-FTS2 is optimized for the characterization of continental-scale sources and sinks. TANSO-FTS2 utilizes a pointing mirror to perform off-nadir measurements at the same location on each 6-day repeat cycle. The pointing mirror allows TANSO-FTS2 to observe up to ±35° across track and ±40° along-track. These measurements nominally consist of 5 across track points spaced ~160km apart with a ground footprint diameter of approximately 9.7 km and a 4 second exposure duration. The satellite has an intelligent pointing monitor camera which makes it possible to adjust the line of sight of the FTS to steer away from cloud contaminated areas. Whilst the majority of data is limited to measurements over land where the surface reflectance is high, TANSO-FTS2 also observes in sun-glint mode over the ocean.

3. RemoTeC retrieval algorithm

The CH₄_GO₂_SRPR product is retrieved from GOSAT-2 TANSO-FTS spectra using the RemoTeC algorithm that has been developed jointly by SRON and Karlsruhe Institute of Technology (KIT). The algorithm retrieves simultaneously XCH₄ and XCO₂. For the retrieval, we analyze four spectral regions: the 0.77 µm oxygen band, two CO₂ bands at 1.61 and 2.06 µm, as well as a CH₄ band at 1.64 µm. Within the retrieval procedure the sub-columns of CO₂ and CH₄ in different altitude layers are being retrieved. To obtain the column averaged dry air mixing ratios XCO₂ and XCH₄ the sub-columns are summed up to get the total column which is divided by the dry-air columns obtained from ECMWF model data in combination with a surface elevation data base. As the Proxy retrievals perform a non-scattering retrieval, the retrieved XCH₄ column cannot be used directly, as effects of aerosol scattering modify the light path. To correct the scattering effects, in the Proxy approach, the retrieved XCH₄ column is divided by the retrieved XCO₂ column at the 1.61 µm band and then multiplied by the XCO₂ total column obtained from the Copernicus Atmosphere Monitoring Service (CAMS) (Chevallier 2019, 2020, 2021).

The retrieved XCH₄ has been validated against ground based TCCON measurements. To further improve accuracy of XCH₄ product, a bias correction has been developed based on TCCON comparisons. We use the GGG2020 release of the TCCON data (Wunch et al., 2015, Laughner et al. 2021). More details on the technical aspects of the retrievals can be found in the ATBD GO₂-SRPR document (Barr et al. 2023).

4. XCH₄ RemoTeC Proxy data product (Feb. 2019 – Dec 2023)

In this section, we show examples of the GOSAT-2 XCH₄ Proxy data product by showing global averaged maps (Sec. 4.1) and by giving a summary of the validation results relative to TCCON (Sec. 4.2).

4.1 Global maps

Figure 1 shows global average maps of the RemoTeC GOSAT-2 Proxy XCH₄ data product with the bias-corrected XCH₄ data and scaled random error, which is described in detail in the uncertainty budget (E3UB, Barr et al. 2024). The GOSAT-2 Proxy XCH₄ product provides a good global spatial coverage. As can be seen, in some regions the coverage is limited by cloud cover (the observations correspond to cloud free scenes), sun illumination conditions, etc. The error on XCH₄ varies from around 10 ppb to 18 ppb and is higher for high latitude regions and low albedo areas.

		11. July 2024

4.2 Validation with TCCON

This section summarizes the main validation results presented in the RemoTeC GOSAT-2 ESA GHG CCI+ End-to-End ECV Uncertainty Budget (E3UB) document version 5.0 (Barr et al. 2024). We used ground based TCCON GGG2020 (Laughner et al. 2021) data obtained from <https://tccondata.org/> as reference data set. We co-located GOSAT-2 and TCCON measurements with a maximum time difference of 2.5h, a maximum distance of 300 km in both longitudinal and latitudinal directions. In cases of multiple TCCON measurements of the same site collocating with a GOSAT-2 sounding, we averaged the TCCON measurements.

The mean bias (global offset) amounts to -0.23 ppb. The standard deviation of the site biases (spatial accuracy or station-to-station variability) is 5.2 ppb. TCCON observes these gases with a precision on mole fractions of ~0.15 % and ~0.2 % for CO₂ and CH₄, respectively (Toon et al., 2009). The single measurement precision of GOSAT-2 compared to TCCON amounts to 15.69 ppb. The validation results are summarised in Table 1.

Figure 3 shows the collocations of GOSAT-2 Proxy XCH₄ for land observations, and Figure 4 the same for observations over ocean (sunlint), with the TCCON sites. Detailed bias and scatter (i.e., single sounding precision measured by the standard deviation of the difference to TCCON after removing systematic effects) are described in the E3UB (Barr et al. 2024).

		Version 5.0 (contractual version 2)
		11. July 2024

Figure 2: GOSAT-2 XCH₄ for soundings over land plotted against TCCON, for the RemoTeC Proxy product. Data are compared only if they are fully colocated in space and time. The standard deviation of the population, Pearson's correlation coefficient and number of retrievals are given in the inset. The legend plots the different TCCON stations where markers are as follows. Stations that are along the coast and also sensitive to glint mode (ocean) measurements are indicated as circles. Those that have high latitudes in the northern and southern hemispheres are upward triangles and crosses, respectively. Stations in Asia, North America and Europe are indicated by squares, pluses and downward triangles respectively.

Figure 3: Same as Figure 3 but for soundings taken in glint mode.

4.3 Bias correction

From comparison with TCCON it was found, that the error in XCH₄ is highly correlated with the retrieved albedo α at window 2 (1600 nm). Based on this correlation, the following bias correction for land observations has been developed.

$$\text{XCH}_{4\text{corr}} = \text{XCH}_4 * (a + b * \alpha)$$

with $a = 0.9906$, $b = 0.00934$. The bias correction parameters are obtained by the fitting of GOSAT-2 and TCCON differences.

 GHG-CCI+ project	ESA Climate Change Initiative “Plus” (CCI+) Product User Guide (PUG) XCH₄ GOSAT-2 SRON PROXY (CH₄_GO₂_SRPR) for the Essential Climate Variable (ECV) Greenhouse Gases (GHG)	Page 13
		Version 5.0 (contractual version 2)
		11. July 2024

For sun-glint observations, it is found that XCH₄ error is correlated with the O₂ ratio R_{O₂}. It defines the ratio between retrieved and prior O₂ column. In this case, a similar correction function is applied,

$$\text{XCH}_{4\text{corr}} = \text{XCH}_4 * (a + b * \text{R}_{\text{O}_2})$$

with a = 0.9700 and b = 0.0215.

5. Description of data format

5.1 Product Content and Format

The RemoteC XCH₄ data product is stored per day in a single NetCDF file. Retrieval results are provided for the individual GOSAT-2 spatial footprints. The product file contains the key products, i.e., the retrieved column averaged dry air mixing ratio XCH₄ with and without bias correction. Information relevant for the use of the data is included in the data file, like the vertical layering and averaging kernels. Also, the parameters that are retrieved simultaneously with XCH₄ are included (e.g., surface albedo), as well as retrieval diagnostics like retrieval errors, quality of the fit.

Table 2: Common dimensions for the CH₄_GO₂_SRPR product.

Dimensions	Type	Unlimited	Units	Description
sounding_dim	int	no		Number of sounding
polarization_dim	int	no		Number of polarization = 2
level_dim	int	no		Number of level = 5
layer_dim	int	no		Number of layer = 4
window_dim	int	no		Number of retrieval window = 4
char_l1bname	int	no		Number of character of L1B name = 44

Table 3: Common variables for the CH₄_GO₂_SRPR product.

Name	Type	Dim.	Units	Description
solar_zenith_angle	float	n	degrees	Angle between line of sight to the sun and local vertical
sensor_zenith_angle	float	n	degrees	Angle between the line of sight to the sensor and the local vertical

		Version 5.0 (contractual version 2)
		11. July 2024

5.2 Quality Flags and Metadata

To use the data products, users are encouraged to check the corresponding quality flag. In the NetCDF files, the quality flag, namely `xch4_quality_flag`, has been generated. The quality flag takes the form of a quality assurance (QA) value, with a range of values from 0 to 1, where 0 is considered to be the best quality data. Increasing the QA value taken will give more data but increase the uncertainty, e.g. QA ≤ 0.4 will give better coverage but larger scatter in the bias with TCCON.

- 0.8 to 0: progressively better quality data (quality has been checked).
- 1: data should not be used (e.g. bad fit to data, residual cloud contamination)

TCCON validation results (precision) for each QA value can be seen in Figure 7 for XCH₄.

Quality Filtering

Quality filtering is conducted through the use of a trained random forest classifier model which predicts the quality of the retrievals based on a selection of retrieval parameters, such as the cirrus signal, intensity offset, slope of the continuum etc.

The random forest model is trained on GOSAT-2 collocations with TCCON, where retrievals are classified via the bias. Retrievals in the training set are flagged as good quality if the bias is within a certain range and those outwith this range are flagged as bad quality. The model then learns the relationship between the quality of the retrieval and the selection of retrieval parameters on which it is trained, and uses these to predict the quality of all future data.

Data TCCON are also used in the validation of the final product. The random forest model is trained in a supervised way, where the model is given values for a selection of features as well as a classification label. Thus inclusion of the same data in both training and predicting can lead to artificial features, as the model has already seen the target label in training and therefore simply predicts this. In order to avoid this, we implement a temporal extrapolation by excluding one year from the training data,

and using the resulting model to make the quality predictions for the excluded year. This results in one model per year of filtered data. Here we assume that the relationship between retrieval quality and features used in training is not temporally dependent. Figure 8 shows the classification metrics for the random forest model for 2021.

Figure 7: Plot of the number of retrievals flagged as good against the precision as a function of QA value for and XCH₄ Proxy products. The cross marks the parameter space for filtering the data product with threshold criteria (v2.0.0).

A consequence of training the random forest model on GOSAT-2 collocations with TCCON is that retrievals with surface albedo ≥ 0.4 are absent from the training sample, due to the lack of TCCON stations in high albedo areas. To circumvent this we define a set of high albedo data to include in the training set using a list of threshold criteria (following v2.0.0 of this product). Furthermore the random forest method is limited only to land retrievals due to the low number of collocations over ocean. For ocean measurements we then also apply the threshold criteria for determining the quality flag. The criteria are as follows where any retrieval that does not satisfy all of these is assigned a 1 for the quality flag:

For land and ocean (sun-glint):

- Number of iterations < 10
- Cost function (chi2) < 18.0
- Signal to noise ratio (SNR) > 50
- Std. deviation of surface elevation within GOSAT-2 ground pixel < 150 m

 GHG-CCI+ project	ESA Climate Change Initiative “Plus” (CCI+) Product User Guide (PUG) XCH₄ GOSAT-2 SRON PROXY (CH₄_GO₂_SRPR) for the Essential Climate Variable (ECV) Greenhouse Gases (GHG)	Page 20
		Version 5.0 (contractual version 2)
		11. July 2024

- Solar zenith angle (SZA) < 75°
- 0 < Blended Albedo < 0.8
- 0.98 < CO₂ ratio < 1.08
- 0.91 < O₂ ratio < 1.05
- 0.92 < H₂O ratio < 1.25

The yield and accuracy of the data of the final product is directly correlated to the strictness of the classification of the training dataset.

Figure 8: *Top:* The ROC curve (left) shows the true positive rate vs. false positive rate at different classification thresholds. Lowering the classification threshold classifies more items as positive, thus increasing both false positives and true positives. In the precision-recall (right) curve, a high area under the curve represents both high recall and high precision, where high precision relates to a low false positive rate, and high recall relates to a low false negative rate. *Bottom left:* List of features used in the model in order of importance from top to bottom. *Bottom right:* Confusion matrix comparing number of correct predictions.

		Version 5.0 (contractual version 2)
		11. July 2024

5.3 Recommended data usage

It is strongly recommended to only use the bias-corrected data in, except if users explicitly correct for biases themselves (e.g. in an inverse modeling framework). The bias correction has been developed independently for land and sun-glint observations.

If the data are to be compared with other XCH₄ data for which vertical profile information is available (e.g. inverse modeling, comparison to models, comparison to measured profiles), the column averaging kernels should be used. Here, it should be noted, that **the column averaging kernels are to be applied to layer sub-columns (m-2)**, as these are the quantities directly retrieved by the RemoTeC algorithm.

For model comparisons, the retrieved XCH₄ should be compared to $[VCH_4]'_{\text{model}}/[VAIR]_{\text{model}}$, where $[VAIR]_{\text{model}}$ is the total dry air column provided by the model and $[VCH_4]'_{\text{model}}$ is the model total CH₄ column after applying the column averaging kernel, viz.:

$$[VCH_4]'_{\text{model}} = [VCH_4]_{\text{prior}} + \mathbf{a}^T (\mathbf{x}_{\text{model}} - \mathbf{x}_{\text{prior}})$$

where $[VCH_4]_{\text{prior}}$ is the prior CH₄ total column used in the retrieval, $\mathbf{x}_{\text{model}}$ is the vertical CH₄ profile from the model (as sub-columns) and $\mathbf{x}_{\text{prior}}$ is the prior vertical profile from the retrieval. For application of the column averaging kernel, the model vertical profile should be re-calculated on the vertical grid of the retrieval (preferred) or the averaging kernel has to be interpolated to the vertical grid of the model.

5.4 Tools for Reading the Data

The data are stored in NetCDF format which can be read with standard tools in the common programming languages (IDL, Matlab, Python, Fortran90, C++, etc).
